

Final Research Paper Guidelines

Due **April 29 23:59** via email hangnpt@neu.edu.vn

You have conducted research in collaboration with your group members. Based on the collaborative research, you will write up a research paper individually in your own words (approx. 20-25 pages, 30 pages max., double-spaced, plus appendix and bibliography).

In your paper, you should identify a research question and include literature review, a description of the dataset, the variables used, and the statistical techniques used for your analysis. You will then summarize the main results and attach appropriate tables / graphs (derived from Python/R outputs) at the end. You are expected to use time series models you have learnt during the course as part of your analysis, but this should not preclude you from using other statistical techniques.

In reporting the results of your analysis, you should discuss how they relate to the literature. Your literature review should include at least 5 academic sources. In your conclusions, you may discuss broader implications of your research (e.g., contribution to the literature, policy implications, relevance to important issues in society).

All submissions must be your own work. Plagiarism or excessive similarity with other sources will result in penalties. Late submissions without prior permission will result in a 10% deduction per day from the total score. Please submit your paper via email (hangnpt@neu.edu.vn) by 23:59 on April 29, 2026.

Suggested Structure:

1. Introduction (about 2 pages)
 - a. Identify your research question
 - b. Explain the significance of the question
2. Literature Review & Background (about 3-4 pages)
 - a. Provide background information or context to set out your research
 - b. Summarize what has been studied in your area (what we know already and what we still don't know that's worth knowing)
 - c. Explain how your research relates to existing studies
3. Methods (about 1-2 pages)
 - a. Describe the data
 - b. Describe the variables you picked to analyze (the dependent variable & independent variables. Dependent and independent variables: what they measure and why they are chosen)
 - c. Describe the statistical techniques that you used for your analysis
4. Results (4-5 pages)

Describe the results of your quantitative analysis and interpret them

- a. Provide descriptive statistics (e.g., mean, standard deviation, min., max., frequencies... for your dependent and independent variables)
 - b. (If relevant) Provide results of analysis using other statistical techniques
– e.g., pre-tests, etc...
 - c. Results of your analysis
 - d. Clearly interpret the economic meaning of your results and discuss statistical significance where relevant.
5. Discussion & Conclusions (about 3 pages)
 - a. Summarize your key findings
 - b. Discuss the implications of your findings in relation to the literature (e.g., whether your results support or contradict previous studies).
6. Bibliography (3-4 pages)
 - a. Provide full bibliographic details for all of the sources you cite in text
 - b. Do not include sources not specifically referred to in your report
 - c. List at least 5 scholarly (academic) sources
 - d. Only the following reference style is acceptable:
APA reference style
<https://apastyle.apa.org/style-grammar-guidelines/references/examples>
7. Appendices (1-2 pages)

Please attach as appendices relevant tables and figures, summarizing the key results from your statistical analysis. Each table / figure should be labelled (e.g. Table 1, Table 2) with an appropriate title, and you should indicate to what part of your report each table is linked. Please also attach the Python/R outputs that show the statistical analysis you conducted. You may include images and other visual material (optional).
